

# **RIP COMMANDS**

## **AIM**

The aim of the experiment is to implement the Routing Information Protocol (RIP) commands.

## **APPARATUS REQUIRED**

Cisco Packet Tracer

## **THEORY**

The Routing Information Protocol (RIP) is one of the oldest distance-vector routing protocols which employ the hop count as a routing metric. RIP prevents routing loops by implementing a limit on the number of hops allowed in a path from source to destination. The largest number of hops allowed for RIP is 15, which limits the size of networks that RIP can support. RIP implements the split horizon, route poisoning and hold-down mechanisms to prevent incorrect routing information from being propagated. In RIPv1 router broadcast updates with their routing table every 30 seconds. In the early deployments, routing tables were small enough that the traffic was not significant. As networks grew in size, however, it became evident there could be a massive traffic burst every 30 seconds, even if the routers had been initialized at random times. In most networking environments, RIP is not the preferred choice for routing as its time to converge and scalability are poor compared to EIGRP, OSPF, or IS-IS (Intermediate System to Intermediate System) . However, it is easy to configure, because RIP does not require any parameters unlike other protocols. RIP uses the User Datagram Protocol (UDP) as its transport protocol and is assigned the reserved port number 520.

## PROCEDURE

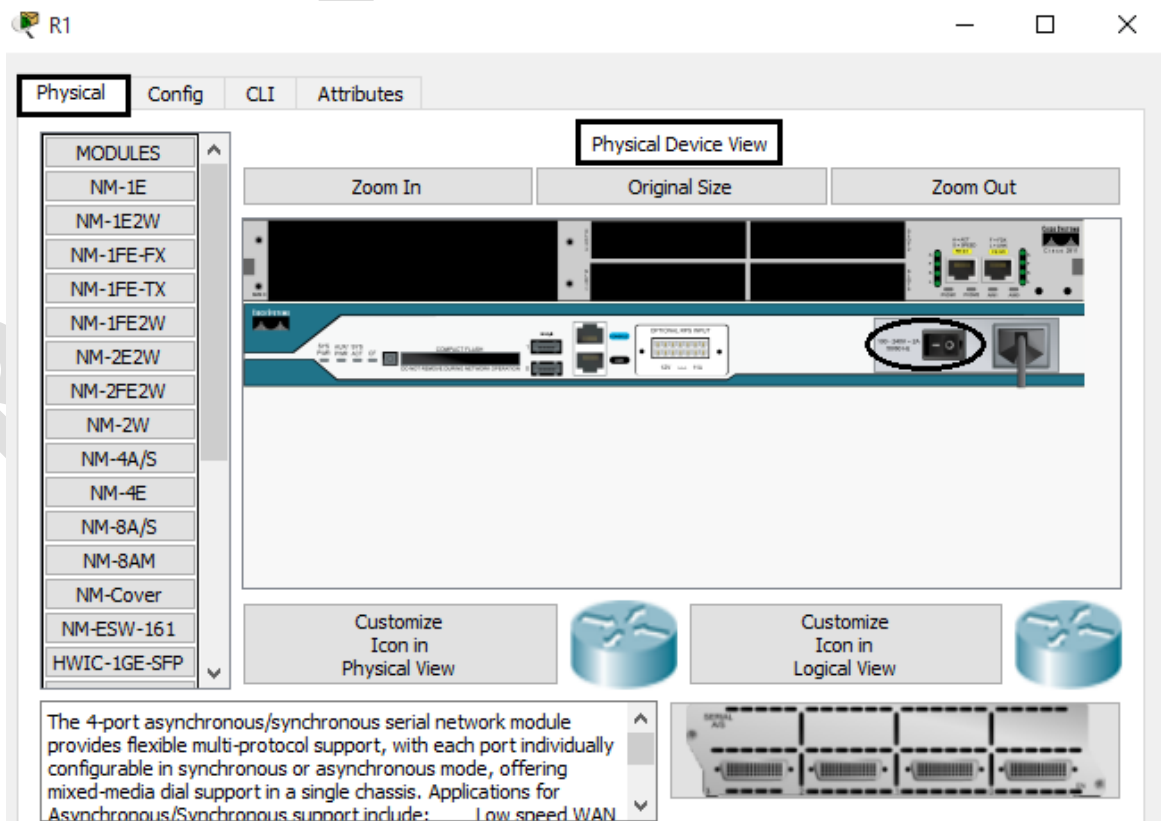

1. Press Ctrl+Alt+R to display the Routers panel and place the two 2811 routers: i.e. Router0 and Router1 as shown by dragging them from the panel and dropping them onto the window.

2. You may rename the Routers on the window by clicking once on the text written "Router0" and giving the new name "R1". Similarly, for the Router1 as R2.

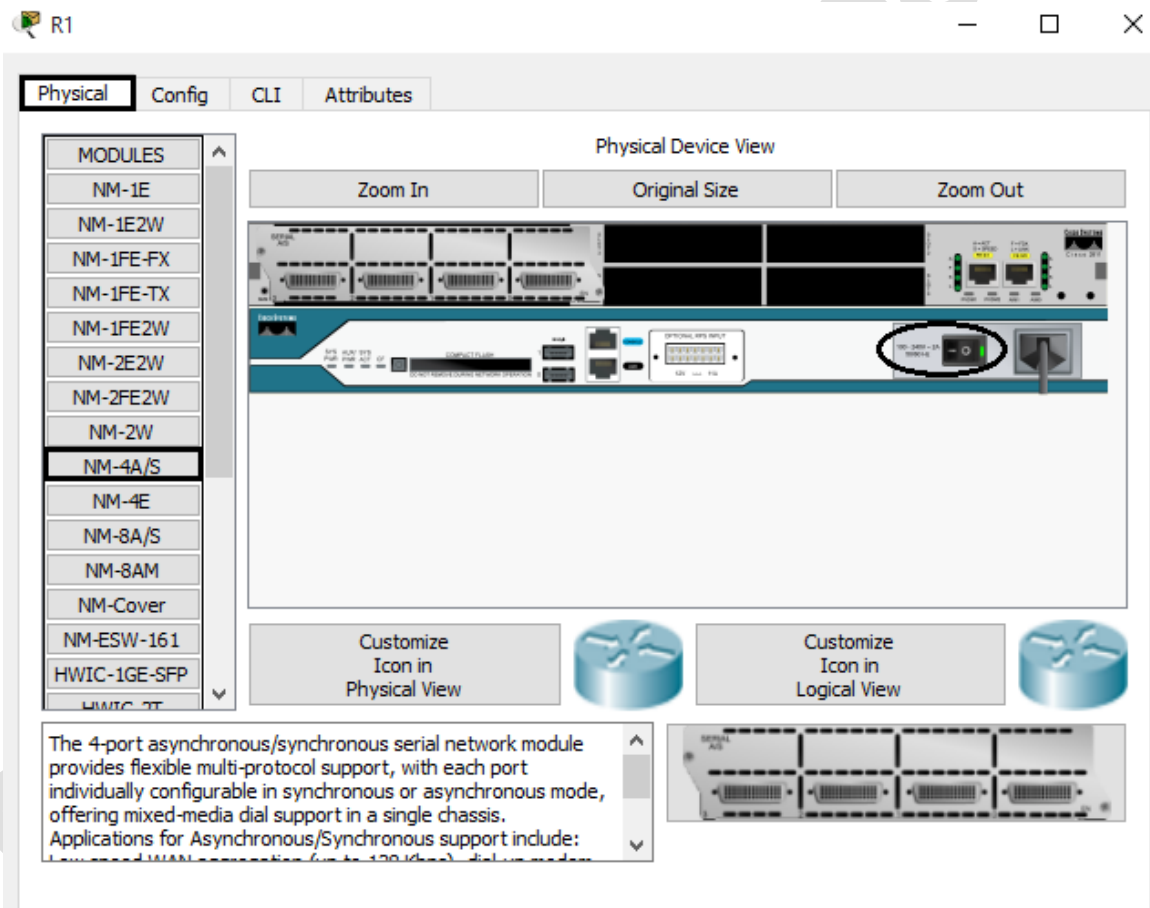

3. Click on the Router "R1". Under the Physical tab, scroll to the Physical Device View and switch off the Router by pressing once on the Rocker Switch shown.

4. Under the Modules, click on the 4-port asynchronous/synchronous serial network module (NM-4A/S) from the list and drag and drop it onto the Router slot as shown in the figure below and then switch the Router back on by pressing the Rocker Switch once.

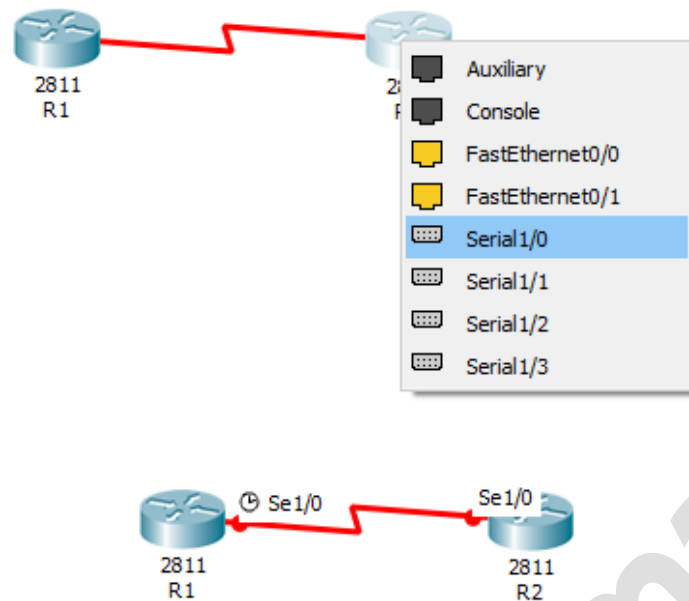

The 4-port asynchronous/synchronous serial network module provides flexible multi-protocol support, with each port individually configurable in synchronous or asynchronous mode, offering mixed-media dial support in a single chassis. Applications for Asynchronous/Synchronous support include: Low speed Wide Area Network (WAN)

aggregation (up to 128 Kbps), dial-up modem support, Async or Sync connections to management ports of other equipment, and transport of legacy protocols such as Bi-sync and Synchronous Data Link Control (SDLC).

5. Repeat the procedure in steps 3 and 4 for the Router “R2” and add the NM-4A/S module to its slot.
6. Press Ctrl+Alt+O to display the connections panel. Select the Serial DCE (Data Circuit-terminating Equipment) cable. Click on the Router R1 and select the Serial1/0 port and then click on the Router R2 and also select the Serial1/0 port to set the connection.

7. Click on the Router R1 and select the CLI (Command Line Interface) tab and enter the following commands. Type “no” or “n” when asked if you would like to enter the initial configuration dialog and press Enter twice.

--- System Configuration Dialog ---

```
Would you like to enter the initial configuration dialog? [yes/no]: no
```

```
Router>enable
```

```
Router#configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Router(config)#hostname R1
```

```
R1(config)#interface Serial1/0
```

```
R1(config-if)#ip address 10.0.0.1 255.0.0.0
```

```
R1(config-if)#clock rate 64000
```

```
R1(config-if)#no shutdown
```

```
%LINK-5-CHANGED: Interface Serial1/0, changed state to down
```

```
R1(config-if)#exit
```

```
R1(config)#router rip
```

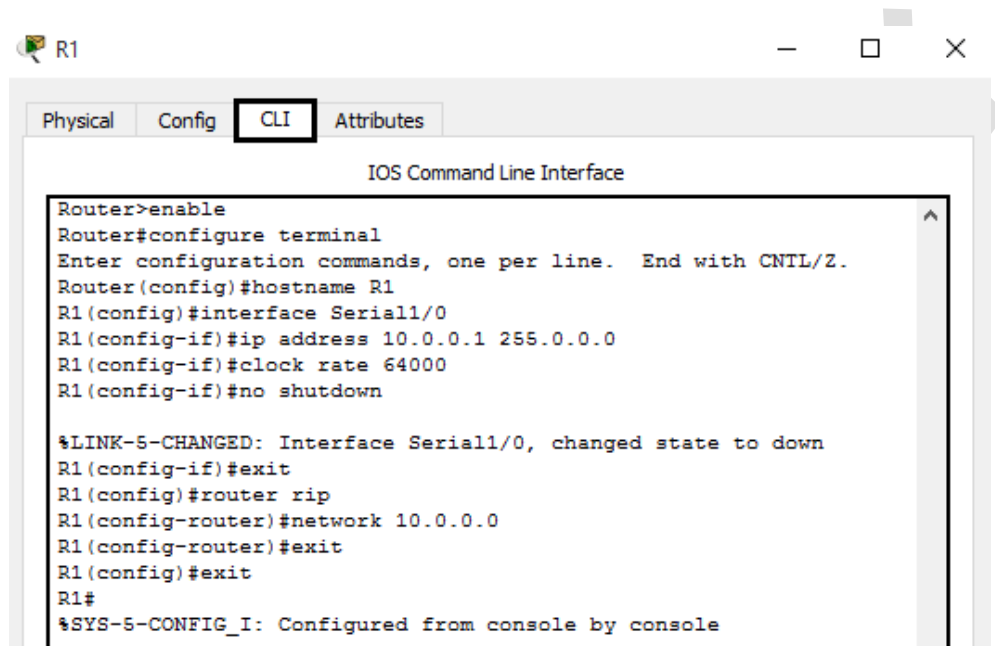

R1(config-router)#network 10.0.0.0

R1(config-router)#exit

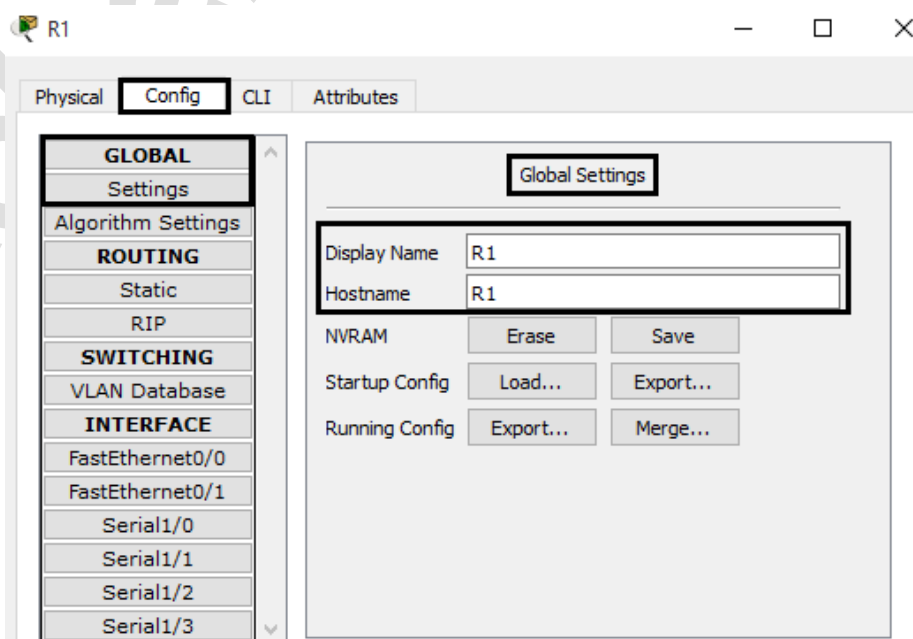

R1(config)#exit

R1#

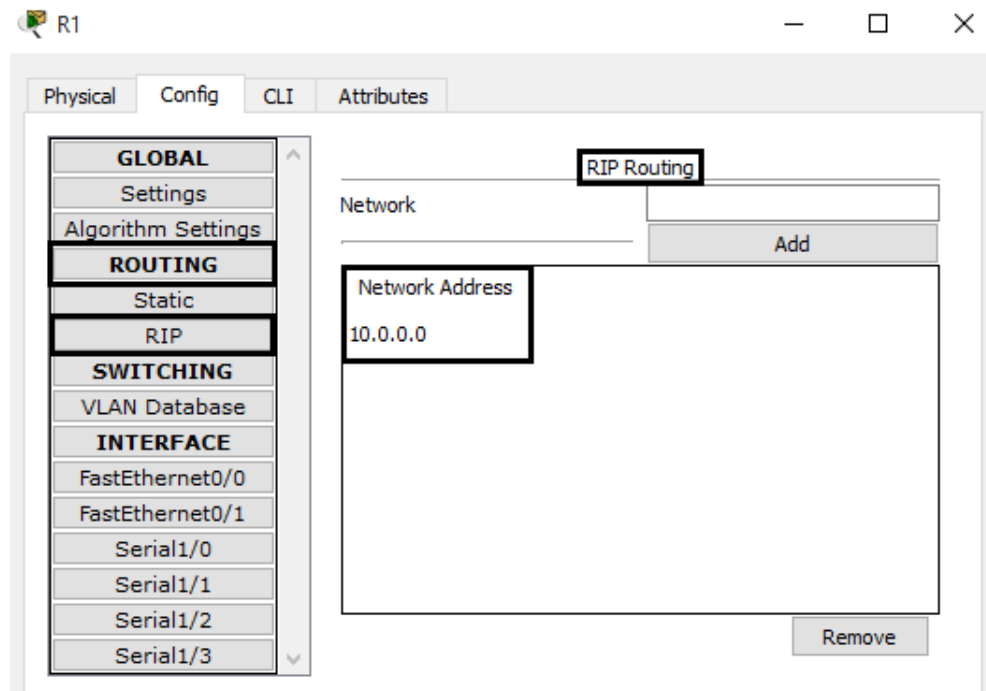

%SYS-5-CONFIG\_I: Configured from console by console

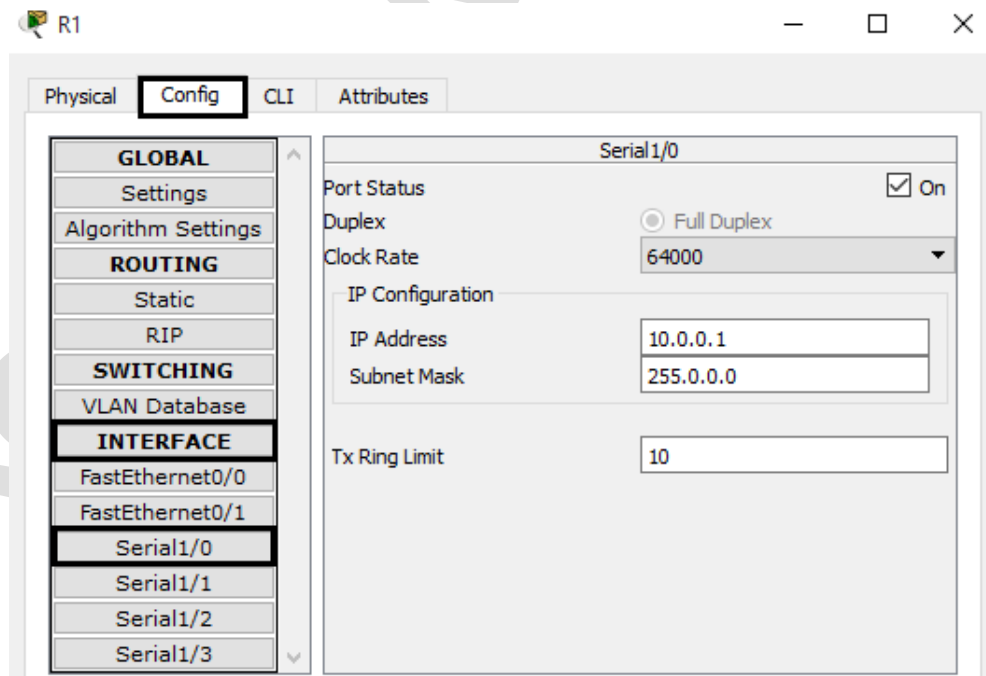

- Click on the Router R1 and select the “Config” tab. Under the Global Settings tab, verify the display and host name of the Router R1.

9. Under the Routing RIP tab, verify the network address of the Router R1.

10. Under the Serial 1/0 Interface tab, verify the Port Status, Clock Rate, IP Address and Subnet Mask.

11. Click on the Router R2 and select the CLI (Command Line Interface) tab and enter the commands as in the Router R1.

```
Router>enable
```

```
Router#configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Router(config)#hostname R2
```

```
R2(config)#interface Serial1/0
```

```
R2(config-if)#ip address 10.0.0.2 255.0.0.0
```

```
R2(config-if)#no shutdown
```

```
R2(config-if)#
```

```
%LINK-5-CHANGED: Interface Serial1/0, changed state to up
```

```
R2(config-if)#exit
```

```
%LINEPROTO-5-UPDOWN: Line protocol on Interface Serial1/0, changed state to up
```

```
R2(config)#router rip
```

```
R2(config-router)#network 10.0.0.0
```

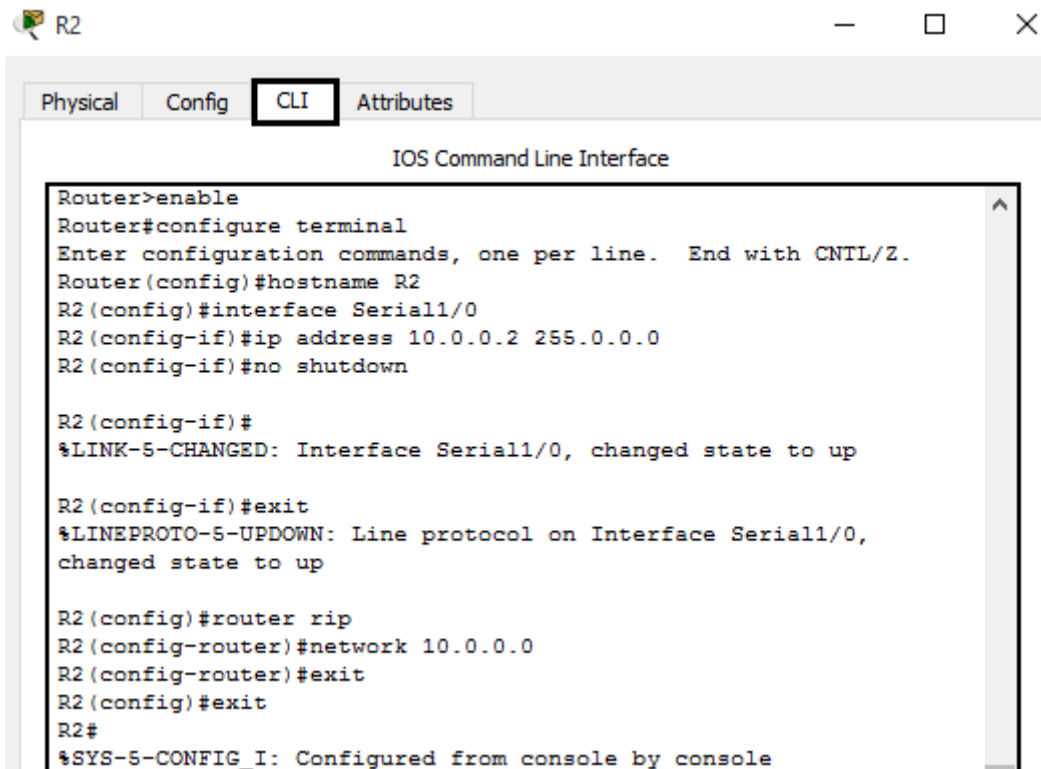

```
R2(config-router)#exit
```

```
R2(config)#exit
```

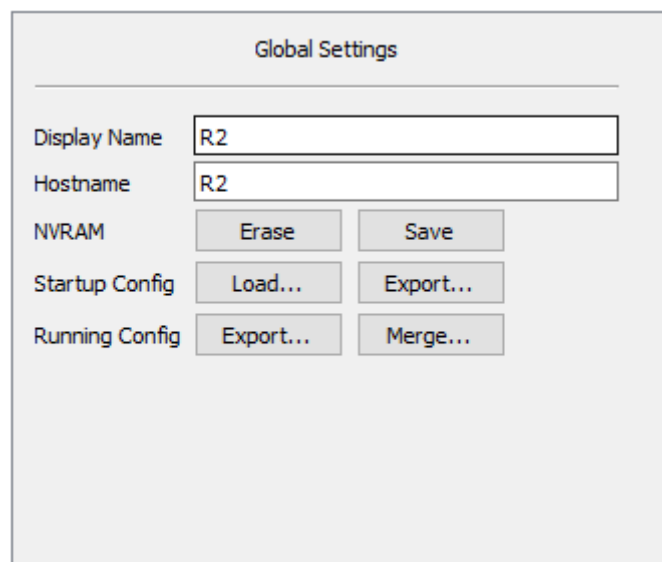

```
R2#
```

```
%SYS-5-CONFIG_I: Configured from console by console
```

12. Click on the Router R2 and select the “Config” tab to verify the Router’s Configuration Settings as in steps 8, 9 and 10 for the Router R1.

RIP Routing

Network	
<input type="button" value="Add"/>	
<div>Network Address</div> <div>10.0.0.0</div>	
<input type="button" value="Remove"/>	

Serial1/0

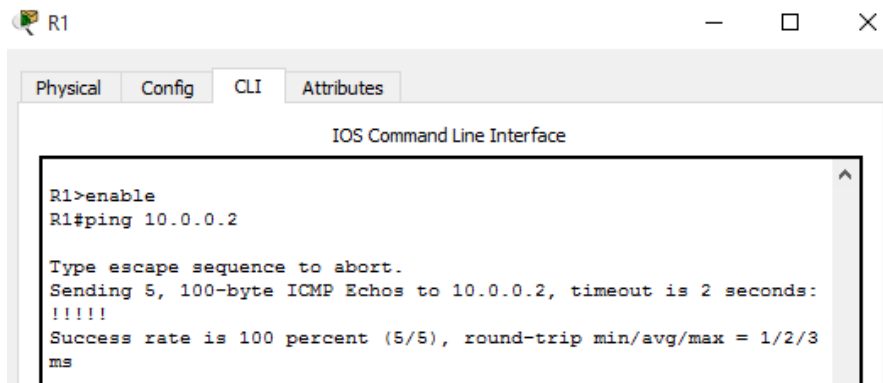

Port Status	<input checked="" type="checkbox"/> On
Duplex	<input type="radio"/> Full Duplex
Clock Rate	1200
IP Configuration	
IP Address	10.0.0.2
Subnet Mask	255.0.0.0
Tx Ring Limit	10

13. Test the connection by the ping command. Select the Router R1 and ping it with the IP address of the Router R2 (10.0.0.2).

R1>enable

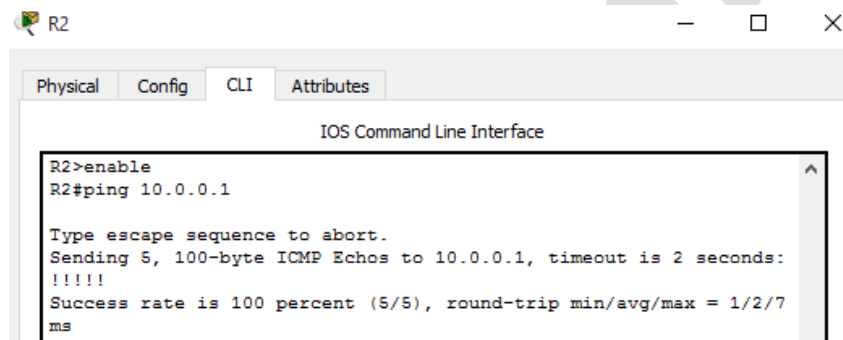

R1#ping 10.0.0.2

14. Select the Router R2 and ping it with the IP address of the Router R1 (10.0.0.1).

R2>enable

R2#ping 10.0.0.1

15. Check the Router's Configuration via the Command Line Interface.

R1>enable

R1#show running-config

Building configuration...

Current configuration : 853 bytes

```

16. Send a Protocol Data Unit (PDU) from the Router R1 to the Router R2 and from the Router R2 to the Router R1 to test the connection by clicking on “Add Simple PDU” or pressing “P” then clicking on the first Router followed by clicking on the next Router. Press Ctrl+Shift+O to toggle the PDU list window and view the Fire Status.

PDU List Window										
Fire	Last Status	Source	Destination	Type	Color	Time(sec)	Periodic	Num	Edit	Delete
	Successful	R1	R2	ICMP		0.000	N	0	(edit)	(delete)
	Successful	R2	R1	ICMP		0.000	N	1	(edit)	(delete)

17. Press Ctrl+Shift+D to Delete the Scenario and all PDUs. Press Shift+S to enter into the Simulation Mode. Press “P” to Add a Simple PDU. Click on the Router1 then click on the Router2. Press Alt+C or on the Simulation Panel under the Play Controls click on the Capture/Forward button multiple times until you observe successful implementation of the (Cisco Discovery Protocol) CDP under the Event List on the Type Column.

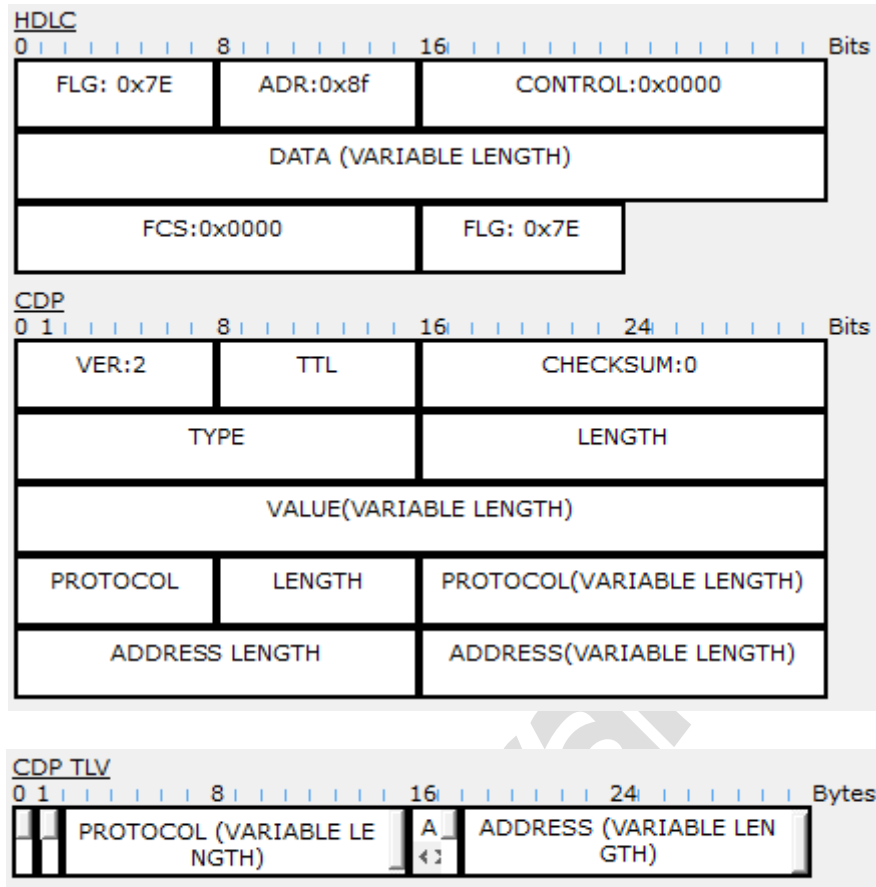

Simulation Panel					
Event List					
Vis.	Time(sec)	Last Device	At Device	Type	Info
	0.000	--	R1	ICMP	
	0.001	R1	R2	ICMP	
	0.002	R2	R1	ICMP	
	50.009	--	R1	CDP	
	50.010	R1	R2	CDP	
	58.951	--	R2	CDP	
	58.952	R2	R1	CDP	

Reset Simulation ☒ Constant Delay Captured to: 58.952 s

18. Observe the PDU Information at the Device by clicking on the CDP event in the Event List. Under the OSI Model Tab view the “In Layers” model. Click on the Next Layer Button to observe the processes taking place at each layer of an event. Under the Inbound PDU Details tab you may observe the PDU Formats i.e. (High-Level Data Link Control) HDLC, CDP, CDP TLV (Type Length Values).

At Device: R2 Source: R1 Destination: Broadcast	
<b>In Layers</b>	<b>Out Layers</b>
Layer7	Layer7
Layer6	Layer6
Layer5	Layer5
Layer4	Layer4
Layer3	Layer3
Layer 2: HDLC Frame HDLC CDP Frame	Layer2
Layer 1: Port Serial1/0	Layer1

1. The device de-encapsulates the payload from the HDLC frame and sends it to the upper layer.
2. The frame is a CDP frame. The CDP process processes it.
3. The CDP process received a neighbor device ID.
4. The CDP process received an address TLV.
5. The CDP process received a neighbor port ID.
6. The CDP process received neighbor capabilities.
7. The CDP process received a neighbor version.
8. The CDP process received a neighbor platform.
9. The CDP process adds the neighbor and starts the hold timer.

## SAMPLE OUTPUT

Robert Karamagi

## **RESULT**

Thus, the experiment to implement the Routing Information Protocol commands was executed successfully and the output is verified.
